UDS-PROi[®] Internet Software

The UDS-PROi[®] software is an application that you can access via the Internet. It allows you to access your data “any time, anywhere.” Our latest release includes all of the familiar features of our UDS-PRO[®] desktop application, plus several exciting new features. It is housed within the UDS Central[™] website, which merges on-demand reports with a wide array of subscriber resources.

Reports

The UDS-PROi[®] software provides a comprehensive set of real-time reports that help you monitor indicators such as LOS-to-date for patients in care, goal attainment, and case-mix index. The **Medicare Presumptive Eligibility Estimation Report (PEER)** shows facilities their estimated compliance with CMS’s 60% rule. Subscribers who have received their presumptive eligibility test results from their FI or MAC have stated that our report has given them an estimate **within 1% of their actual percentage of qualifying cases**. The application also provides outcomes data with national and regional benchmarks for RICs, CMGs, and patient-level drill-down, plus parameters and a wide variety of filters.

Custom fields

The UDS-PROi[®] software allows you to name your custom fields to better reflect the type of information stored in them. You can even configure them as dates, drop-down menus, or checkboxes.

Customizable case listing options

You can customize the case listing view more than ever before. The UDS-PROi[®] software allows you to select columns for display, including the MSI and IRF Compliance fields. You can also choose sorting options, select how many records you want each window to display, and filter unnecessary data from your view. You can also print the IRF-PAI form for multiple cases at once and lock or unlock groups of cases.

HL7[®] interface

The UDS-PROi[®] software has HL7[®] interface capability, providing you with a robust platform that reduces data entry and integrates multiple information systems and diverse departmental systems.

Enhanced user security features

Not only do we use two levels of authentication for the application itself, but we also allow you to set periodically expiring passwords on a per user basis. You can even reset passwords for all users if needed.

Enhanced Profile Report capabilities

Our enhanced Profile Report includes case-based CMG goals and 50th, 75th, and 90th percentile goals for the patient. These goals are based on outcomes from hundreds of thousands of IRF-PAI cases.

Informatics data

Our informatics module allows you to compare your facility’s real-time data with regional and national benchmark data by CMG to analyze patient expectations for goals and discharge plans.

Pre-admission features

The newly enhanced pre-admission screening module provides several features, such as flags for cases that require a physician’s signature or reassessment, that will help you comply with MBPM rules and regulations. This module, which includes all the pre-admission screen elements required by CMS, includes the FIM[®] screen, a nine-item assessment that projects a case’s CMG, ELOS, and expected burden of care and eliminates the need to complete the function modifiers and all 18 FIM[®] items at pre-admission. The module’s customizable lists can help you track referring physicians, referring facilities, and attending physicians at your facility. The module also captures electronic signatures, and the final pre-admission report can be printed or saved as part of the case’s final medical record. If a patient is not admitted to your facility, you can select the reason for the patient’s nonadmission from a customizable list. The module also shows potential 60% rule presumptive compliance statistics for each case in the pre-admission listing.

Cost fields, referral information, and resource utilization

The UDS-PROi[®] software contains fields that you can use to track costs, referral information, and resource utilization. Not only can you track cost information for each patient, but you can set up facility cost averages by CMG, RIC, or IGC. In addition, new fields for bed number, room number, floor number, and referring physician have been added. And you can save federal prospective payment (FPP) values with effective dates. This information provides accurate historical calculations in the event that your facility’s wage index changes or that CMS again changes the standardized payment conversion factor (SPCF, formerly BNCF).

FIM[®] Track module

This module allows you to track admission and discharge ratings for a patient over a 3-day period and transfer these ratings directly to the appropriate fields in the patient’s case record. The software’s rating selection process is dictated by the most current IRF-PAI rating guidelines.

Audit Denial Tracking System module

The ADTS module allows you to manage documentation requests and payment denials as they progress through the appeals process. ADTS reports are available from the real-time reports module.
